An ultrasonic generator with a power up to 10 kilowatts
with magnetostrictive vibrators, operating with a fre-
quency of 20-22 kilocycles, is required for the cleaning
of jets under industrial conditions. A generator with
this power is able to carry out a simultaneous cleaning
of several scores of jets. The cleaning of jets takes
4-6 min. instead of hours, as in the case with the
chemical method applied at present. The ultrasonic
treatment does not corrode the spinning jets and does
not affect the dimensions or the shape of the orifices.

[v. 11] no. 2, p. 71-76.

The viscosity of 8 tin-bismuth alloys and of pure tin
was examined with a rotation-type viscosimeter. The
viscosity of molten metals containing insoluble ad-
mixtures showed hysteresis. Molten metals that were
purified of such admixtures by filtration in vacuum did
not exhibit any viscosity hysteresis. The insoluble
admixtures retard the process of recoordination of the
atoms (and, consequently, the change of viscosity)
during which the atoms pass from the low-temperature
packing to the high-temperature packing.
